Vue Considerations

1. Complexity of components
2. Component dependant hierarchy
3. Browser compatibility
4. Debugging - a must
5. Production output from Vue.
6. Impact of current c-net UI
7. State management
8. Hot reloading for development
9. Package management/upgrade policy
10. API comms strategy
11. Cross site scripting prevention (httpclient in angular?)
12. Lazy loading components in views
13. Single file bundling when in development mode
14. Do we want a MVC UI core sprinkled with areas on vue alongside knockout?
15. Maybe have a completely separate Vue app with a repository that loads into an area on a page in c-net ui app. Leads to other considerations:-
    a. Transfer authentication token.
    b. Transfer data from app to another.
16. Modules for state areas
